Several storm systems across Central Alabama brought limited improvement to the ongoing drought, that had begun in the Spring of 2007. In the first week of March, the last remaining area of Exceptional (D4) Drought was eliminated in Central Alabama, and by the end of the month, the area of Extreme (D3) Drought had been reduced as well. This area was roughly from the cities of Birmingham, Centreville, Selma, Montgomery, and Auburn, north and eastward. Most of the remainder of Central Alabama remained in Moderate (D1) to Severe (D2) Drought.

## Storm Data and Unusual Weather Phenomena - March 2008

Location	Date/Time	Deaths & Injuries	Property & Crop Dmg	Event Type and Details
	03/15/08 08:47 CST		0.96M	Tornado (EF2, L: 6.04 mi , W: 675 yd)
	03/15/08 08:57 CST		0	Source: NWS Storm Survey

The tornado touched down just east of CR-27, about 5 miles south-southeast of Oneonta. It then moved north of River Road, through the Highland Lake community, and across CR-29 near the Appalachian Community. The Appalachian School property sustained damage, but the school was spared any significant damage. The tornado continued northeastward and strengthened as it nearly paralleled CR-12, before lifting just north of the intersection of CR-12 and US-231. Along the entire path, several hundred trees were either snapped off or were uprooted. A few dozen chicken houses were damaged and many were destroyed. Many outbuildings, garages, and sheds were destroyed. At least 25 homes sustained major damage, and another few dozen received minor damage. At least one mobile home was destroyed and a few more were damaged. At least 6 cows and hundreds of chickens were killed by flying debris. In some instances, the roof debris from damaged structures was blown over one half mile downstream. A few feed silos were tipped over and one rolled at least one half mile.

Finally some longer-term drought relief came to the Tennessee Valley in March. Rainfall deficits for the year barely grew and rainfall amounts were almost near normal. A significant cold front moved through on the 3rd and 4th and was the month's biggest rainmaker in many areas. But periodic rain, and even a little snow, continued to fall throughout the month, about every four days.

However, by March 20th, dry high pressure built into the Tennessee Valley and turned off the rainfall for most of the rest of the month, with only trace amounts beyond that.

Drought conditions improved approximately one category across the board. By the end of March, none of the WFO Huntsville Hydrologic Service area was in the D4 /Exceptional Drought/ category, though more than half of the area was still in the D3 /Extreme Drought/ category.

Three rounds of severe weather, associated with a stalled out frontal boundary, occurred in northern Alabama on the 14th and 15th.

A cold front moved through northern Alabama late in the afternoon and evening on the 14th and produced large hail in portions of northeastern Alabama. This cold front stalled out near Birmingham Alabama and into northwestern Georgia the evening of the 14th, before moving north over northern Alabama early on the 15th as a warm front. A severe convective complex developed along the warm front, and produced several occurrences of damaging wind across northern Alabama.

By early on the 15th, a low pressure area developed along the front over northern Louisiana and intensified as it moved northeast into middle Tennessee during the afternoon of the 15th. Additional wind damage and large hail occurred ahead of the cold front.
