Water reached several portions of the Valley Trail between Picnic Areas 7 and 10 in Rock Creek Park, and completely covered the Rolling Meadows Trailbridge. The peak level of 8.02 feet occurred at 3:45 AM on the 16th. A potent upper-level low and associated area of surface low pressure approached the region from southwest on the 15th. Strong forcing for ascent and ample moisture transport in advance of the upper level low led to a prolonged period of rain across the region. Eventually low pressure transferred to the coast before precipitation wound down on the 16th. Widespread rainfall totals of 2-4 inches were observed across the area. (DC-Z001) DISTRICT OF COLUMBIA 12/17/18 00:47 EST 0 Coastal Flood 12/18/18 08:30 EST 0 An influx of freshwater due to heavy rain led to increased water level anomalies and coastal flooding along the Potomac River. 12/22/18 20:33 EST 0 Source: River/Stream Gage te river gage on the Potomac River at Edwards Ferry exceeded the 15 foot flood stage during the indicated period. Water reached the boat ramp and wer parking area at Edwards Ferry, and began to inundate areas near Whites Ferry. The peak level of 16.08 feet occurred at 9:00 AM on the 23rd.  Illowing immediately on the heels of the system that produced flooding on the 20th in VA, another wave of low pressure tracked up prog the spine of the Appalachians on the 21st. Showers and thunderstorms moved across the area during the afternoon hours of the st, locally producing an additional 1-2 inches of rain on top of previously saturated solis. This rainfall eventually led to some ger-stem river flooding on the 22nd and 23rd as the runoff drained downstream. (WV-Z505) WESTERN PENDLETON 0 Winter Weather 12/04/18 21:00 EST 12/05/18 16:00 EST 0 An upper level disturbance tracked eastward from the Ohio Valley in the morning of December 5th. This moved across the region during the morning hours, aided by the left front quadrant of an upper jetmax. The disturbance then exited during the afternoon hours. Areas of light snow moved across portions of the region, although meaningful accumulations were confined to the higher elevations. (WV-Z506) EASTERN PENDLETON 12/09/18 11:00 EST 0 Winter Weather 12/09/18 21:00 EST 0 An area of low pressure developed along the Gulf Coast on December 8th and tracked northeastward along the North and South Carolina coastlines during the daytime hours on the 9th, strengthening to around 1000mb by the evening. The low then exited eastward off the coast of Cape Hatteras and weakened on the night of the 9th. Accumulating snow clipped portions of eastern WV, with a sharp cutoff to completely dry conditions north of Pendleton County. The river gage on the Potomac River at Shepherdstown exceeded the 15 foot flood stage during the indicated period. River Road was completely flooded in low spots between Shepherdstown and Harpers Ferry. Water covered the pedestrian bridge to the Shepherdstown boat ramp and significant portions of the C&O canal were flooded. Water approached homes on the West Virginia side of the river near Shepherdstown and impacts to roads and structures were also observed on the Maryland side of the river. The peak level of 22.11 feet occurred at 3:00 AM on December 17th.

The stream gage on the Shenandoah River at Millville exceeded the 10 foot flood stage during the indicated period. Portions of Bloomery Road, John Rissler Road, Wilt Road as well as a few rural roads in Clarke County, VA experienced flooding. Moulton Park, the Millville boat launch, and portions of the Cool Spring Battlefield also flooded. The peak level of 12.80 feet occurred at 9:30 PM on December 16th.

The river gage on the Potomac River at Harpers Ferry exceeded the 18 foot flood stage during the indicated period. The C&O Canal towpath on the Maryland side of the river experienced flooding. Floodwaters also covered much of the Hamilton Street area, as well as the employee parking lot in historic Harpers Ferry. The peak level of 18.81 feet occurred at 2:30 AM on December 17th.

A potent upper-level low and associated area of surface low pressure approached the region from southwest on the 15th. Strong forcing for ascent and ample moisture transport in advance of the upper level low led to a prolonged period of rain across the region. Eventually low pressure transferred to the coast before precipitation wound down on the 16th. Widespread rainfall totals of 2-4 inches were observed across the area.

The stream gage on the Cacapon River at Great Cacapon exceeded the 9 foot flood stage during the indicated period. Rock Ford Road flooded in multiple locations, including flowing completely over the low water bridge. Flooding was also observed along Constant Run Road. The peak level of 9.28 feet occurred at 1:00 PM.

Following immediately on the heels of the system that produced flooding on the 20th in VA, another wave of low pressure tracked up along the spine of the Appalachians on the 21st. Showers and thunderstorms moved across the area during the afternoon hours of the 21st, locally producing an additional 1-2 inches of rain on top of previously saturated soils. This rainfall eventually led to some larger-stem river flooding on the 22nd and 23rd as the runoff drained downstream.

(WV-Z051) MORGAN, (WV-Z052) BERKELEY, (WV-Z053) JEFFERSON

12/28/18 16:53 EST 0 Dense Fog

12/28/18 20:01 EST

Clearing skies, falling temperatures, and abundant low level moisture led to the formation of dense fog.
