Mid-Atlantic and southeastern United States with divergent flow aloft and deep moist southerly flow at the surface. Moderate instability developed by the afternoon hours with strong speed and directional shear aloft. This led to two distinct rounds of showers and thunderstorms across the waters, with the first round in the late afternoon hours, and a second round in the evening. A few

A closed upper level low moved eastward from Missouri and Arkansas and into Tennessee through the daytime hours of April 19th, and then moved northward into Kentucky during the night. At the surface, low pressure moved from near Tennessee in the morning to eastern Kentucky by the evening, and into Ohio by late in the night, intensifying along its track. This brought strong forcing across the

thunderstorms produced strong gusty winds over the waters.

PM EDT (2:20 PM EST). At this location, four pine trees snapped about halfway up, and fell toward the northeast; one small tree along the southeast side of the path snapped at the base and fell toward the southwest; two other pine trees snapped halfway up and fell toward the north or northwest. There were also numerous large limbs scattered around this area. Damage was confined to a path that expanded slightly in width to about 125 yards. The circulation reached JM Pearce Road just east of MD-138 Shepperd Road at 3:21 PM EDT (2:21 PM EST). At least ten trees were snapped in a 150-yard wide path here. Three trees on the northwest side of the path fell toward the south or southeast, with the rest falling toward the northwest to northeast. All of the trees that fell were softwoods (mainly pines). At 3:22 PM EDT (2:22 PM EST), the tornado reached MD-138 Shepperd Road in the 2900 block. Over a dozen trees were snapped between the base and halfway up at this location. Additionally, half a dozen trees were topped. The trees that were snapped closer to the base were along and southeast of the roadway, and fell facing the northwest, north and northeast. The trees that had their tops snapped off were along the north side of the road, and blew south across the road onto adjacent properties. A house at a horse barn had two screens blown in toward the northeast, and the slide of a swing set on the property was torn off and blew toward the northwest. Steel barns on the property sustained no notable damage, and no shingles or siding were removed from the house. The last instance of tornadic damage was noted at the intersection of Shepperd Road and MD-562/138 Troyer Road. Several softwood trees were snapped here, as well, facing southwest, south and southeast. Given the intermittent tree damage (snapped trees), and the fact that very little if any structural damage was noted, it is concluded that maximum wind speeds were 80 to 90 MPH. Above this speed is when most sturdy structures start sustaining notable	the road, and fell toward the northeast. fourth tree (softwood, pine) just to the n implying a circulation reached the surfa	Across the street in a wooded area, a t orth snapped halfway up, and fell towa ce at this	third tree (hardwoo rd the south. Scattered around this area. Damage was confined to a path that expanded slightly in width to about 125 yards. The circulation reached JM Pearce Road just east of MD-138 Shepperd Road at 3:21 PM EDT (2:21 PM EST). At least ten trees were snapped in a 150-yard wide path here. Three trees on the northwest side of the path fell toward the south or southeast, with the rest falling toward the northwest to northeast. All of the trees that fell were softwoods (mainly pines). At 3:22 PM EDT (2:22 PM EST), the tornado reached MD-138 Shepperd Road in the 2900 block. Over a dozen trees were snapped between the base and nalfway up at this location. Additionally, half a dozen trees were topped. The trees that were snapped closer to the base were along and southeast of the roadway, and fell facing the northwest, north and northeast. The trees that had their tops snapped off were along the north side of the road, and blew south across the road onto adjacent properties. A house at a horse barn had two screens blown in toward the northeast, and the slide of a swing set on the property was torn off and blew toward the northwest. Steel barns on the property sustained no notable damage, and no shingles or siding were removed from the house. The last instance of tornadic damage was noted at the intersection of Shepperd Road and MD-562/138 Troyer Road. Several softwood trees were snapped here, as well, facing southwest, south and southeast. Given the intermittent tree damage (snapped trees), and the fact that very little if any structural damage was noted, it is concluded that maximum wind speeds were 80 to 90 MPH. developed during the late morning and early afternoon hours which helped to support showers and thunderstorms across the region, and this combined with moderate levels of wind speed shear, led to strong to severe thunderstorms which produced locally damaging winds. There was also enough low level directional shear to produce a tornado in central Maryland.

VIRGINIA, North

A tree was blown down in the 1700 block of Piedmont Road.

Low pressure tracked from the Great Lakes northeastward into southern Ontario and Quebec on April 8th as a cold front and upper level trough moved into the Ohio Valley. Instability was large enough out ahead of this system to generate showers and scattered thunderstorms, one of which became severe in central Virginia.

A tornado produced a discontinuous line of damage along a path approximately four miles long, lasting five minutes through Reston, Virginia. The tornado was rated EF-0, with peak winds of 70 miles per hour and maximum path width of 100 yards. The tornado's storm motion was north-northeast at approximately 50 miles per hour. The damage was primarily uprooted or topped trees. No injuries or fatalities were reported with this tornado.

The first evidence of damage was near Fox Mill Road and Pinecrest Road where several trees were downed at approximately 8:55 EDT (7:55 EST). Isolated tree damage from this point to near the USGS complex on Sunrise Valley Drive was noted, with several trees topped along Glade Drive near Rosedown Drive. After passing across the Dulles Toll Road (Virginia State Route 267), minor tree damage was noted between Sunset Hills Road and Baron Cameron Avenue. The tornado then tracked across Reston Hospital Center, with no visible signs of damage, but damage was noted just north of the hospital on Town Center Drive near Town Center Parkway, where a tree was topped, fencing blown down, and shingles blown off several townhouses.

After crossing Baron Cameron Avenue, the tornado passed just east of Trader Joe's grocery store destroying an outdoor shed. Nearby, a tall, two-foot diameter tree crashed through the upper floor of a townhouse on Quietree Drive that led local officials to condemn the property. Several large trees were either uprooted or topped along Bennington Woods Road between Crosswind Drive and Reston Parkway. A large, 100-foot tall tree fell and smashed the front end of an unoccupied vehicle parked along Center Harbor Road, midway between Reston Parkway and North Village Road. Minor tree damage along a narrow path was noted in neighborhoods located between North Village Road and Reston Parkway between Center Harbor Road and Wiehle Avenue. No substantial storm damage was noted north of Wiehle Avenue, where the tornado weakened and lifted at 9:00 PM EDT (8:00 PM EST).

A closed upper level low moved eastward from Missouri and Arkansas and into Tennessee during the daytime hours of April 19th, and then moved northward into Kentucky during the night. At the surface, low pressure moved from near Tennessee in the morning to eastern Kentucky by the evening, and into Ohio by late in the night, intensifying along its track. This brought strong forcing across the Mid-Atlantic and southeastern United States with divergent flow aloft and deep moist southerly flow at the surface. Moderate instability developed by the afternoon hours with strong speed and directional shear aloft. This led to two distinct rounds of showers and thunderstorms across northern and central Virginia, with the first round in the mid to late afternoon hours, and a second more organized round in the evening that evolved into a quasi-linear convective system. Some of the thunderstorms became severe with locally damaging winds. Two tornadoes were also confirmed, one from a supercell in the late afternoon, and one from the quasi-linear convective system in the late evening.

An upper level trough east of the Mississippi River on the morning of April 26th deepened and closed off over the eastern Great Lakes by the morning of April 27th. A forced convective line was ongoing in the morning hours of April 26th over West Virginia and progressed eastward into Virginia during the afternoon hours. A few individual cells also formed ahead of this convective line. Modest instability

eastward into Virginia during the afternoon hours. A few individual cells also formed ahead of this convective line. Modest instability developed during the late morning and early afternoon hours which helped to support showers and thunderstorms across the region, and this combined with moderate levels of wind shear led to strong to severe thunderstorms which produced locally damaging winds.
