A tree was blown down in the 1400 block of East Macphail Road.

A very strong cold front passed through the area while a potent upper-level trough was positioned just to our west. Strong winds aloft were able to mix down in heavier showers and thunderstorms due to an unstable atmosphere. Low-level winds changing speed and direction with height combined with a thunderstorm to trigger an isolated tornado.

CARROLL COUNTY --- 1.0 NW FRIZZELLBURG [39.61, -77.08], 0.8 NNW FRIZZELLBURG [39.61, -77.08]

A brief EF1 tornado touched down in the 2000 block of Leeward Drive between Westminster and Taneytown in rural Carroll County, Maryland during the early afternoon hours of Monday, April 13th, 2020

The tornado developed on the north end of a small surge in the line over northwestern Carroll County. Directly under this radar signature was a path of concentrated and convergent tree damage spanning no wider than 75 yards and less than half a mile in length

Damage was first evident on the ground on the property of a residence on the west side of Leeward Drive (about a quarter to half mile south of MD-832 Old Taneytown Road). Many large and healthy softwood (pine) trees were snapped, and several small trees were pushed over. The trees fell towards each other in a convergent manner indicating a rotating vortex in contact with the ground. A house on the property sustained substantial damage, particularly to the garage -- both bay doors were pushed inwards and the garage itself was shifted slightly from the foundation. Multiple shingles and pieces of the roof were blown off of the home. A large recreational vehicle at the residence was pushed over and appears to have been lofted briefly (for a few feet) given the fact it was sideways and facing the opposite direction from its initial position.

The tornado crossed Leeward Drive, toppling several more trees and causing shingle and siding damage at a second residence. No further damage was evident by the time the path reached MD-832 Old Taneytown Road.

The damage to the homes (shingle and siding removal, garage displacement) and trees (healthy softwood trees snapped) as well as the displacement of the large recreational vehicle, coupled with the magnitude of velocity and height of debris signatures on radar are consistent with a tornado rated EF1 with peak winds of about 90 MPH.

A strong cold front passed through the area on the 13th of April. Strong upward motion led to showers and some thunderstorms, and with very strong winds aloft some of those storms produced damaging winds at the surface. An isolated tornado also occurred as well.
