# Summary of Impacts

Links: See/submit [Condition Monitoring Observer Reports \(CMOR\)](#) and view the [Drought Impacts Reporter](#)

## Hydrologic Impacts

- Many local streams/ivers remain in low flow and stage at below or much below normal levels. Typically, deeply submerged objects will likely be closer to the water's surface or in some cases exposed presenting a waterway hazard for recreational boating and commercial navigation.

## Agricultural Impacts

- Crop condition in the driest of areas remains poor to very poor and pasture lands provide little to no livestock feed. Supplemental feeding is required to maintain livestock condition.

## Fire Hazard Impacts

- The risk of significant wildfire remains above normal over southeast Mississippi and southwest Alabama.

## Societal Impacts

- Increase in air-borne allergens likely to create problems for respiratory sensitive groups.

## Mitigation Actions

- Water conservation techniques are strongly encouraged in drought areas. Please refer to your municipality and/or water provider for mitigation information. Local water restriction ordinances may be in place.

# Hydrologic Conditions and Impacts

Select River/Stream Points at Below Normal Levels - Valid 8AM October 26, 2023

River/Stream Point	Discharge(cfs)	Stage(ft)	%Class, Rating
Cyprus Creek at Janice MS	8	5.68	17, Below Normal
Red Creek at Vestry MS	132	4.08	10, Much Below Normal
Big Creek at Co. Rd 63 near Wilmer AL	14	1.57	9, Much Below Normal
Chickasaw Creek near Kushla AL	43	2.73	9, Much Below Normal
Styx River near Elsanor AL	115	1.58	11, Below Normal
Pine Barren Creek near Snow Hill AL	31	2.30	15, Below Normal
Alabama River at Claiborne L&D	5810	35.08	16, Below Normal
Blackwater River near Bradley AL	33	0.69	11, Below Normal
Eleven Mile Creek near West Pensacola FL	23	4.70	4, Much Below Normal
Perdido River at Barrineau Park FL	213	1.21	5, Much Below Normal
Shoal River near Crestview FL	266	2.19	4, Much Below Normal
Yellow River at Milligan FL	208	0.56	7, Much Below Normal

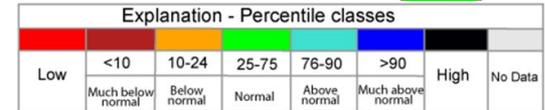

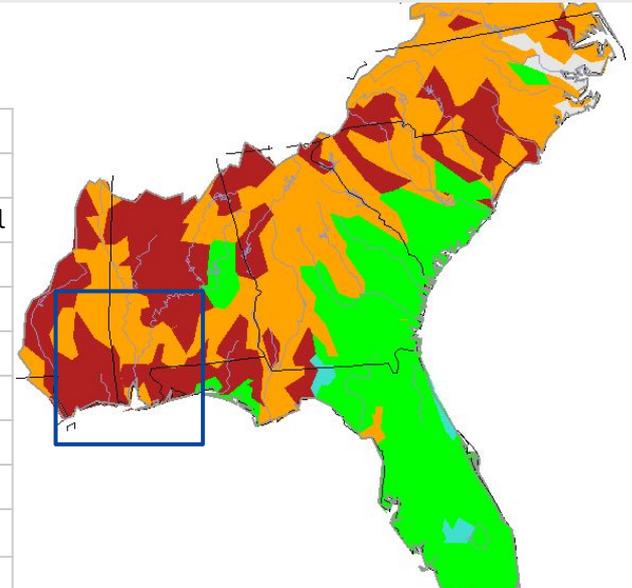

Image Caption: USGS 7 day average streamflow HUC map valid 10/26/2023. Box Inset - Below to much below normal stream/river flow persists over much of the central Gulf Coast.

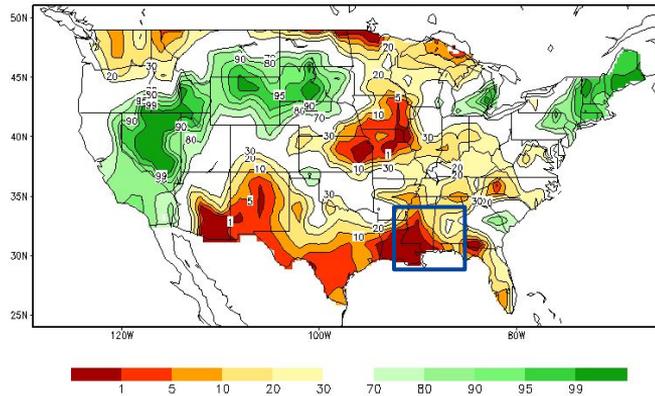

# Agricultural Impacts

- Severe to excessively dry crop moisture continues for much of the local area. In these areas, crop condition is very poor. Crop disease and insect damage elevated.
- Pasture lands provide little to no livestock feed. Supplemental feeding is required to maintain livestock condition.
- Parched sub-soil moisture is leading to very poor crop conditions.
- The latest topsoil moisture content short to very short metrics vs 5-year means (Depth 6", courtesy of USDA 10/22/23):
  - MS: 82% Dry (Avg: 37.8%)
  - AL: 76% Dry (Avg: 28.8%)
  - FL: 30% Dry (Avg: 25.0%)

# Fire Hazard Impacts

Link to [Wildfire Potential Outlooks from the National Interagency Coordination Center](#).

- Decayed timber and very dry underbrush in area forests along with dry grasslands pose an above normal risk for significant wildfire potential over the entire state of Mississippi and Alabama.
- Local park campers are strongly urged to follow park instructions on campfires. Keep camp fires contained in enclosed screens if available. Ensure fires are put out before going to bed.
- To view the seven day significant fire potential maps, please refer to the link above.

# Seven Day Precipitation Forecast

- A cold front is forecast to make passage over the central Gulf coast Monday October 30th, but precipitation with this feature appears to be meager. Less than a tenth of an inch of rain is forecast for the central Gulf coast through the period.

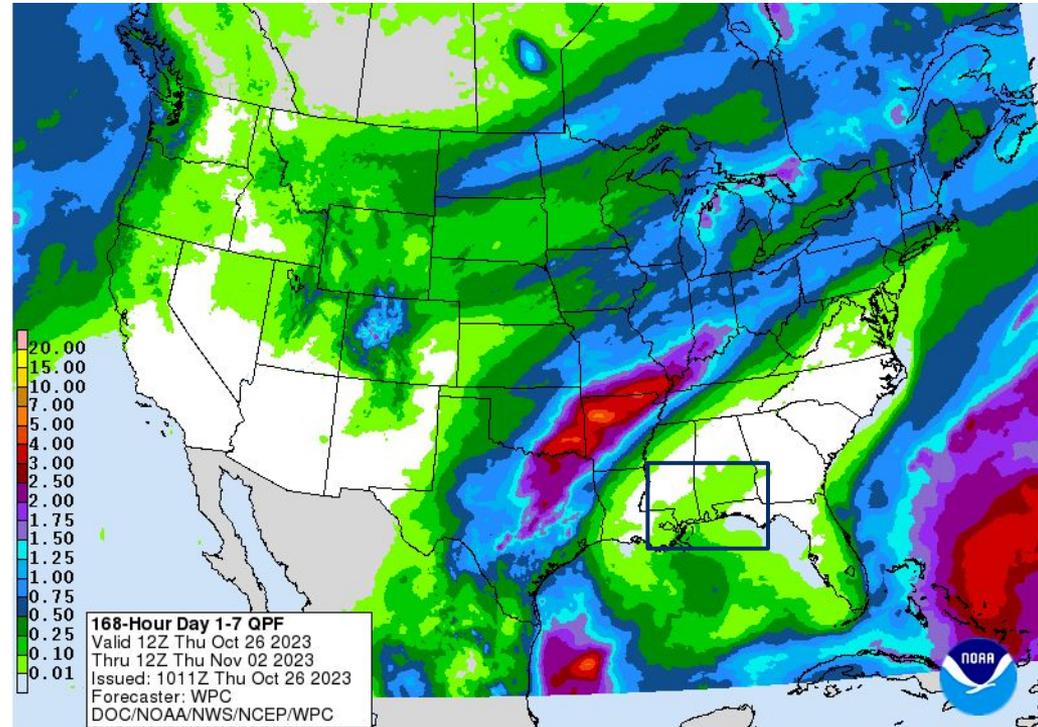

Image Caption: NWS Weather Prediction Center [7-day precipitation forecast](#) valid Thursday October 26 to November 2, 2023 shows only light precipitation through the next 7 days.

# Long-Range Outlooks

The latest monthly and seasonal outlooks can be found on the [CPC homepage](#)

- Temperatures are favored to lean above normal from the Mid-Atlantic Coast down into parts of the Southeast US and across the Gulf Coast through the end of 2023.
- The potential for above normal precipitation is favored from the Mid-Atlantic down into much of the Southeast and Deep South.

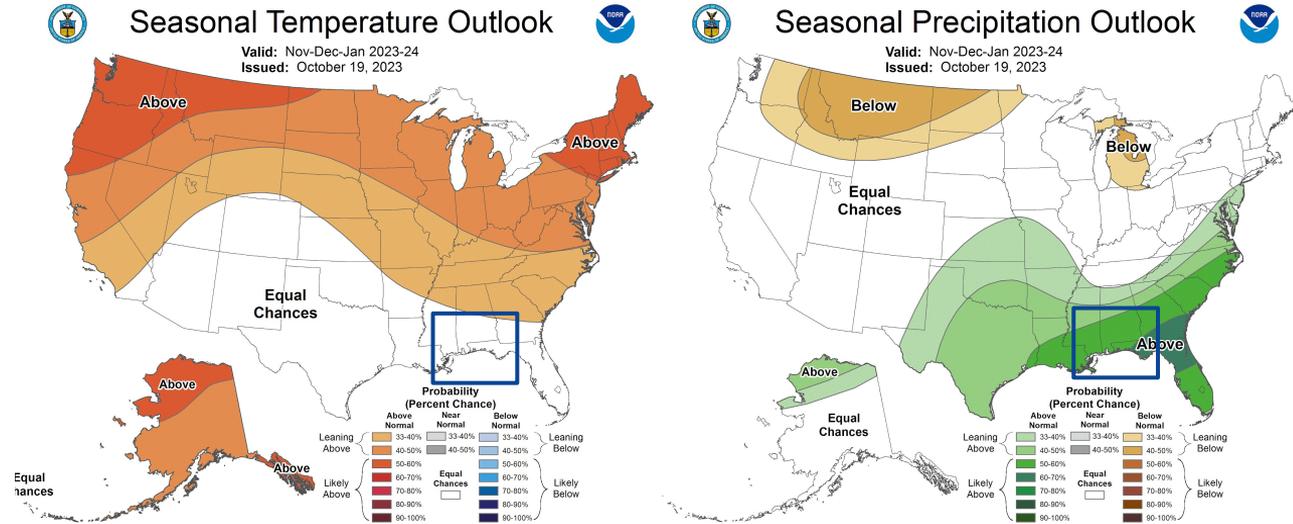

Image Captions: Left - [Climate Prediction Center Seasonal Temperature Outlook](#), Right - [Climate Prediction Center Seasonal Precipitation Outlook](#), Valid October-November-December 2023.

# Drought Outlook

The latest monthly and seasonal outlooks can be found on the [CPC homepage](#)

- Through the remainder of the month of October, drought is favored to persist over much of the local area.
- Drought is favored to remain across the region through the remainder of the season. There are indications, though, of some slight improvement across much of the region moving into the beginning of 2024.

## U.S. Monthly Drought Outlook Drought Tendency During the Valid Period
